

ABSTRACT

A golf ball support body S adapted to be removably attached to a golf tee T having a leg T1 adapted to be inserted into the ground for standing by itself and a horizontally enlarged section T2 disposed above the leg T1, said
5 golf ball support body S comprising a ball support section 10 in the upper end, a large-sized inner section 12 disposed below the ball support section 10 for receiving the horizontally enlarged section T2 of said golf tee T, a small-sized inner section 14 disposed below said large-sized inner section
10 12 for insertion-holding the lower portion of said golf tee T disposed below the horizontally enlarged section T2 so as to prevent downward separation of the golf tee T, and separation preventive inward projections 26 disposed in the upper portion of said large-sized inner section 12 for preventing upward separation of said golf tee T, and said golf ball support body S being
15 able to be attached to the golf tee T in a state in which said lower portion of said golf tee T is held by the small-sized inner section 14 and in which said horizontally enlarged section T2 is received in said large-sized inner section 12 so that upward separation of said golf tee T is prevented by said separation preventive inward projections 26.
